Research on privacy-aware traffic signal control

Privacy-Aware Cooperative Traffic Signal Control and Traffic State Fusion in Smart Cities: State-of-the-Art, Trade-offs, and Research Directions

Quick Reference

Key Findings Table

Aspect	State-of-the-Art	Integration Achieved?	Trade-offs	Gaps & Limitations
Multi-Intersection Decision Support	Decentralized MARL, transformer-based, and graph-based frameworks	Yes, with local/global coordination	Scalability, communication overhead	Poor global coordination in large-scale deployments
Direction-Aware Traffic Fusion	Advanced sensor fusion (camera, radar, LiDAR, IoT), digital twins	Yes, for real-time adaptive control	Data heterogeneity, robustness under adverse conditions	Integration with privacy-preserving methods is limited
Privacy-Preserving Inference	Federated learning, homomorphic encryption, differential privacy, MPC	Partial, mostly in simulation	Computational latency, reduced accuracy	Real-time feasibility, hybrid method integration
SUMO-Based Experiments	Widely used for validation, mixed with real-world datasets	Yes	Simulation-to-reality gap	Handling dynamic, heterogeneous urban conditions
Control Objectives	Flow optimization, congestion reduction, safety, energy	Yes	Utility vs. privacy, robustness	Adaptive objectives under privacy constraints
Reported Trade-offs	Privacy vs. utility, robustness, efficiency	Yes, often quantified	Increased latency, communication cost	Need for hybrid, adaptive frameworks

Direct Answer

Current research demonstrates significant progress in integrating decentralized multi-agent reinforcement learning (MARL), visible light communication (VLC), and advanced sensor fusion for privacy-aware, cooperative traffic signal control in smart cities. Multi-intersection decision support and direction-aware fusion are increasingly combined, but the integration of privacy-preserving or homomorphic-encryption-friendly inference remains partial and often limited to simulation. Trade-offs among privacy, utility, robustness, and efficiency are well-documented, with computational and communication overheads being the main challenges. SUMO-based experiments and real-world datasets are standard for validation, but scalability, seamless hybrid

integration, and real-time performance under privacy constraints remain open research directions [1] [2] [3] [4] [5] [6].

Study Scope

- **Time Period:** Primarily 2018–2024
- **Disciplines:** Computer science, transportation engineering, urban informatics, cryptography
- **Methods:** Multi-agent reinforcement learning, sensor fusion, federated learning, homomorphic encryption, SUMO-based simulation, digital twins, cloud-edge architectures

Assumptions & Limitations

- Most studies are validated in simulation (SUMO) or limited-scale real-world deployments.
- Privacy-preserving methods are often evaluated in isolation, not in fully integrated, city-scale systems.
- Trade-offs are context-dependent and may not generalize across all urban environments.
- Real-time feasibility of homomorphic encryption and hybrid privacy-preserving methods is still under investigation.

Suggested Further Research

- Scalable, communication-efficient hybrid frameworks combining MARL, advanced sensor fusion, and privacy-preserving inference.
- Seamless integration of digital twins with privacy-aware traffic management.
- Adaptive, context-aware privacy mechanisms for heterogeneous, dynamic urban environments.
- Real-world, city-scale deployments and longitudinal studies to validate simulation findings.

1. Introduction

Background and Motivation

The rapid urbanization and proliferation of connected vehicles have made smart city traffic management a critical research area. Traditional fixed or actuated traffic signals are increasingly replaced by adaptive, cooperative systems leveraging real-time data from heterogeneous sources. However, the integration of multi-intersection decision support, direction-aware traffic state fusion, and privacy-preserving inference presents significant challenges. These include the need for scalable coordination, robust sensor integration, and strong privacy guarantees to protect sensitive mobility data in the face of growing cybersecurity threats and regulatory requirements [4] [5] [7] [8].

Recent advances in decentralized multi-agent reinforcement learning (MARL), visible light communication (VLC), federated learning, and homomorphic encryption have enabled more adaptive, privacy-aware traffic

signal control. Yet, the trade-offs among privacy, utility, robustness, and efficiency, especially in large-scale, real-time deployments, remain a central concern [1] [4] [6].

2. Theoretical Frameworks

2.1 Multi-Agent Reinforcement Learning and Decentralized Control

- **MARL** enables decentralized, adaptive control by allowing each intersection to act as an agent, learning optimal policies based on local and neighboring states. Integration with VLC and self-adaptive phase adjustment modules further enhances real-time coordination and privacy by limiting data exchange to local neighbors [2] [9] [10] [11].
- **Transformer-based and graph-based MARL** architectures capture complex spatial-temporal dependencies, supporting global cooperation but facing scalability and credit assignment challenges as the number of intersections grows [12] [13] [14].

2.2 Visible Light Communication (VLC) and Privacy Implications

- **VLC** provides low-latency, high-resolution, and inherently private communication channels for vehicle-to-infrastructure (V2I) and vehicle-to-vehicle (V2V) data exchange. By encoding data in light signals, VLC reduces the risk of interception and supports privacy-respecting cooperative control [15] [16] [17] [18].
- **Hybrid communication architectures** (VLC + mmWave/5G) further enhance reliability and adaptability in complex urban environments [19].

2.3 Privacy-Preserving and Federated Learning Approaches

- **Federated reinforcement learning** allows decentralized training of traffic signal control policies, preserving data privacy by keeping raw data local and sharing only model updates. Techniques such as entropy compression and anonymity-preserving protocols further enhance privacy and reduce communication overhead [20] [21] [22] [23] [24].
- **Auction-based and two-party computation frameworks** enable privacy-preserving priority management at intersections, balancing urgency and privacy [22].

2.4 Scalability and Limitations of Multi-Agent Architectures

- **Scalability** is a major challenge for transformer-based and graph-based MARL systems, with increased agent numbers leading to non-stationarity, high communication overhead, and poor global coordination [12] [13] [14] [25].
- **Physical and topological constraints** require specialized encoding and attention mechanisms, increasing model complexity and limiting transferability across cities [10] [26].

Synthesis: Theoretical advances in decentralized MARL, VLC, and federated learning have enabled more adaptive, privacy-aware multi-intersection traffic control. However, scalability, coordination complexity, and integration with privacy-preserving inference remain open challenges.

3. Methods & Data Transparency

3.1 Sensor Fusion Algorithms and Heterogeneous Data Integration

- **Direction-aware traffic state fusion** leverages data from cameras, radar, LiDAR, IoT devices, and V2X communication to provide accurate, real-time traffic state information for adaptive signal control [27] [28] [29] [30] [31] [32].
- **Advanced fusion algorithms** (e.g., Kalman filtering, Bayesian networks, deep learning) improve detection, tracking, and estimation, especially under adverse weather and complex urban scenarios [33] [34] [35] [36] [37].

3.2 Cloud-Edge Architectures for Scalable Traffic State Fusion

- **Cloud-edge computing** enables scalable, low-latency processing of large volumes of heterogeneous traffic data, supporting real-time adaptive signal timing and direction-aware fusion in large smart cities [38] [39] [40] [41] [42].
- **Middleware solutions** and distributed-to-centralized data management strategies improve agility, scalability, and security [41] [42].

3.3 Robustness Under Adverse Weather and Environmental Conditions

- **Hybrid deep sensor fusion** with uncertainty modeling (e.g., Bayesian, transformer-based) enhances robustness and real-time performance under adverse weather, reducing false positives and improving localization [33] [34] [35] [36] [37].

3.4 Digital Twin-Based Intersection Systems

- **Digital twins** integrate multi-sensor fusion (LiDAR, camera, IoT) with real-time simulation and closed-loop control, enabling proactive traffic management, congestion monitoring, and safety improvements [31] [43] [44] [45].

Synthesis: State-of-the-art methods combine advanced sensor fusion, cloud-edge architectures, and digital twins to support direction-aware, real-time traffic state estimation and adaptive control. However, integration with privacy-preserving inference is still limited.

4. Critical Analysis of Findings

4.1 Privacy-Preserving and Homomorphic Encryption-Friendly Inference

Homomorphic Encryption and Secure Computation Protocols

- **Homomorphic encryption (HE)** allows computation on encrypted traffic data, preserving privacy but incurring high computational costs, which challenge real-time feasibility [4] [46] [47] [48] [49] [50] [51].
- **Secure Multi-Party Computation (MPC)** and secret sharing distribute encrypted data across servers, enhancing robustness against cyberattacks and false data injection [52] [53] [54].

Hybrid Privacy-Preserving Methods: Differential Privacy and MPC

- **Hybrid frameworks** combining differential privacy (DP) and MPC balance privacy and utility, protecting both data providers and individuals with manageable overhead [54] [55] [56] [57] [58].

- **Trade-offs** involve balancing computational complexity, communication overhead, and control performance, with stochastic programming models mitigating noise-induced utility loss [54] [59].

Computational Trade-offs and System Performance

- **Fully homomorphic encryption (FHE)** introduces significant latency and resource consumption, limiting real-time deployment. Federated learning and hybrid methods offer more practical privacy-utility trade-offs but still face challenges in communication overhead and model accuracy [60] [61] [62] [63] [64] [65] [66].

Synthesis: Privacy-preserving inference methods are advancing, but computational and communication trade-offs remain a barrier to real-time, city-scale deployment. Hybrid approaches show promise but require further optimization.

4.2 Datasets, SUMO-Based Experiments, and Performance Trade-offs

Datasets and Experimental Setups

- **SUMO** is the standard simulation platform for evaluating cooperative and privacy-aware traffic signal control, often integrated with real-world datasets (e.g., floating car data, municipal traffic records, sensor fusion) [5] [67] [68] [69] [70] [71] [72] [73].

- **Experimental setups** increasingly consider mixed traffic, communication errors, and varying penetration rates of connected/autonomous vehicles [74].

Control Objectives and Performance Metrics

- **Objectives:** Optimize flow, reduce congestion, improve safety, minimize fuel consumption, and enhance cooperative automated driving [6] [71] [75] [76] [77] [78].

- **Metrics:** Waiting time, queue length, travel time, fuel consumption, communication overhead, privacy risk, and model accuracy.

Trade-offs Among Privacy, Utility, Robustness, and Efficiency

- **Privacy-enhancing technologies** (federated learning, DP, HE) can impact system efficiency, increasing latency and communication costs while sometimes reducing model accuracy [6] [79] [80] [81].

- **Hybrid solutions** (e.g., federated learning with adaptive aggregation, model pruning, and DP) mitigate negative effects, improving privacy-utility balance [55] [82].

Synthesis: SUMO-based experiments and real-world datasets validate privacy-aware cooperative control, but trade-offs and simulation-to-reality gaps persist, especially under dynamic, heterogeneous urban conditions.

5. Real-World Implications

- **Improved Traffic Flow and Safety:** Integration of decentralized MARL, advanced sensor fusion, and direction-aware control reduces congestion, waiting times, and fuel consumption, enhancing urban mobility and safety [1] [3] [6].
- **Privacy Protection:** Federated learning, DP, and HE frameworks protect sensitive mobility data, supporting compliance with privacy regulations and reducing risks of surveillance and cyberattacks [4] [79].
- **Scalability and Adaptability:** Cloud-edge architectures and digital twins enable scalable, adaptive traffic management, but require further integration with privacy-preserving methods for city-scale deployment [38] [43].
- **Trade-offs:** Real-world deployments must balance privacy, utility, robustness, and efficiency, with hybrid frameworks offering the most promising path forward [55] [82].

6. Gaps, Limitations, and Open Research Directions

Identified Gaps and Limitations

- **Scalability:** Current MARL and transformer-based systems struggle with global coordination and communication overhead in large-scale deployments [12] [13] [79] [83].
- **Communication Efficiency:** Privacy-preserving methods often increase latency and resource consumption, limiting real-time applicability [60] [79].
- **Adaptive Privacy-Preserving Learning:** Need for frameworks that dynamically adjust privacy levels based on context, risk, and system state [83] [84].
- **Integration of Heterogeneous Data:** Seamless fusion of diverse sensor data with privacy-preserving inference is still limited, especially under adverse conditions and in digital twin environments [43] [85].
- **Simulation-to-Reality Gap:** Most findings are validated in simulation, with limited real-world, city-scale deployments [5] [6].

Open Research Directions

- **Hybrid, Communication-Efficient Architectures:** Develop frameworks combining MARL, federated learning, advanced sensor fusion, and hybrid privacy-preserving inference for scalable, real-time, city-scale deployment [83] [86] [87] [88] [89] [90].
- **Digital Twin Integration:** Leverage digital twins for systematic validation, optimization, and closed-loop control, integrating privacy-aware sensor fusion and adaptive traffic management [31] [43].
- **Adaptive, Context-Aware Privacy Mechanisms:** Design privacy-preserving methods that adjust to dynamic urban contexts, balancing privacy, utility, and efficiency in real time [55] [83].
- **Real-World, Longitudinal Studies:** Conduct city-scale deployments and longitudinal evaluations to validate simulation findings and refine hybrid frameworks [5] [6].

- **Risk Assessment and Resilience:** Enhance risk assessment for V2X and cooperative driving automation, integrating robust privacy and security mechanisms [60] [83].

Synthesis and Conclusion

Research on privacy-aware cooperative traffic signal control and traffic state fusion in smart cities has made substantial progress by integrating decentralized MARL, VLC, advanced sensor fusion, and federated learning. These advances have improved traffic flow, safety, and privacy protection. However, the integration of privacy-preserving inference (especially homomorphic encryption) with direction-aware fusion and multi-intersection decision support remains partial, with significant trade-offs in computational efficiency and scalability.

SUMO-based experiments and real-world datasets are standard for validation, but simulation-to-reality gaps and the need for adaptive, hybrid frameworks persist. Future research should focus on scalable, communication-efficient architectures, seamless digital twin integration, and adaptive privacy mechanisms, validated through real-world, city-scale deployments.

Table: Comparative Analysis of Key Approaches

Approach	Multi-Intersection Support	Direction-Aware Fusion	Privacy-Preserving Inference	Real-Time Feasibility	Scalability	Main Limitation
MARL + VLC	Yes	Partial	Limited (local privacy)	High	Moderate	Coordination complexity
Sensor Fusion + Digital Twin	Partial	Yes	No	High	High	Privacy integration
Federated Learning	Yes	Partial	Yes	Moderate	High	Communication overhead
Homomorphic Encryption	No	No	Yes	Low	Low	Computational cost
Hybrid (FL + DP + MPC)	Partial	Partial	Yes	Moderate	Moderate	Integration complexity

Creative Insight:
Hybridized architectures combining graph neural networks, federated reinforcement learning, and digital twins may offer a promising pathway to scalable, privacy-aware, and robust traffic management in smart cities. These systems should be validated through real-world, longitudinal studies to ensure effectiveness and adaptability under dynamic urban conditions.

56. Hybrid-secure MPC: Trading information-theoretic robustness for computational privacy Lucas, C., Raub, D., Maurer, U. Proceedings of the Annual ACM Symposium on Principles of Distributed Computing, 2010 https://www.scopus.com/pages/publications/77956238696?origin=scopusAI

57. Enhancing Cloud Data Privacy with a Scalable Hybrid Approach: HE-DP-SMC Singh, J., Reddy, A.M., Bande, V., (...), Samunnisa, K. Journal of Electrical Systems, 2023 https://www.scopus.com/pages/publications/85185200440?origin=scopusAI

58. Secure multi-party variance estimation in unbalanced resource environments Hu, C., Yao, Z., Sun, J., (...), Zhai, Y. Proceedings of SPIE - The International Society for Optical Engineering, 2024 https://www.scopus.com/pages/publications/85207206111?origin=scopusAI

59. Secure adaptive filtering Troncoso-Pastoriza, J.R., Pérez-González, F. IEEE Transactions on Information Forensics and Security, 2011 https://www.scopus.com/pages/publications/79957502579?origin=scopusAI

60. Privacy-preserving computing via homomorphic encryption: Performance, security, and application analysis Naeem, N., Khan, F., Yaqoob, T., Tahir, S. Handbook of Research on Cybersecurity Issues and Challenges for Business and FinTech Applications, 2022 https://www.scopus.com/pages/publications/85143653600?origin=scopusAI

61. A Privacy-Preserving Convolutional Neural Network Inference Framework for AIoT Applications Wang, H., Yang, S., Shao, K., (...), Zhang, Z. Computers, Materials and Continua, 2026 https://www.scopus.com/pages/publications/105028352033?origin=scopusAI

62. SeP²CNN: A Simple and Efficient Privacy-Preserving CNN for AIoT Applications Xiao, T., Zhang, Z., Shao, K., Li, H. Proceedings - 2024 International Conference on Artificial Intelligence of Things and Systems, AIoTSys 2024, 2024 https://www.scopus.com/pages/publications/85215624816?origin=scopusAI

63. Privacy-Preserving Deep Learning in Computational Social Systems via Fully Homomorphic Encryption Wang, L., Zhu, F., Bao, L., (...), Chen, X. IEEE Transactions on Computational Social Systems, 2026 https://www.scopus.com/pages/publications/105029111212?origin=scopusAI

64. Enhanced Private Decision Trees using Secure Multiparty Computation and Differential Privacy Tajima, A., Jiang, W., Marathe, V., Mozaffari, H. Proceedings - 2024 IEEE International Conference on Knowledge Graph, ICKG 2024, 2024 https://www.scopus.com/pages/publications/86000228095?origin=scopusAI

65. A Differentially Private Hybrid Approach to Traffic Monitoring Rocha, R.V.M., Libório, P.P., Kupwade Patil, H., Aranha, D.F. Lecture Notes in Computer Science (including subseries Lecture Notes in Artificial Intelligence and Lecture Notes in Bioinformatics), 2021 https://www.scopus.com/pages/publications/85111118952?origin=scopusAI

66. Hybrid framework of differential privacy and secure multi-party computation for privacy-preserving entity resolution Dorgbefu Jnr, M., Missah, Y.M., Ussiph, N., (...), Mensah, J.M. Computers and Security, 2025 https://www.scopus.com/pages/publications/105011499793?origin=scopusAI

67. Model-based Design of NEMA-Compliant Dual-ring-barrier Traffic Signal Controller Bhadani, R., Sprinkle, J., Head, K.L. Proceedings - 13th ACM/IEEE International Conference on Cyber-Physical Systems, ICCPS 2022, 2022 https://www.scopus.com/pages/publications/85134226606?origin=scopusAI

68. Testing an adaptive cruise controller with coupled traffic and driving simulations Barthauer, M., Hafner, A. EPiC Series in Computing, 2019 https://www.scopus.com/pages/publications/85080035038?origin=scopusAI

69. Privacy-preserving data fusion for traffic state estimation: A vertical federated learning approach Wang, Q., Yang, K. Transportation Research Part C: Emerging Technologies, 2024 https://www.scopus.com/pages/publications/85198331761?origin=scopusAI

70. Microscopic real-time simulation of Dresden using data from the traffic management system VAMOS Oertel, R., Krumnow, M., Krimmling, J., Wagner, P. 19th Intelligent Transport Systems World Congress, ITS 2012, 2012 https://www.scopus.com/pages/publications/84897005805?origin=scopusAI

71. Optimal Control of Traffic Flow Based on Reinforcement Learning Baumgart, U., Burger, M. Communications in Computer and Information Science, 2022 https://www.scopus.com/pages/publications/85140486269?origin=scopusAI

72. Design and Implementation of a Suburban Signal Traffic Control and Management System in the Field of Informatics Sivakumar, V.L., Perumal, P.S., Raju, A. 7th International Conference on I-SMAC (IoT in Social, Mobile, Analytics and Cloud), I-SMAC 2023 - Proceedings, 2023 https://www.scopus.com/pages/publications/85177618590?origin=scopusAI

73. Information fusion for automotive applications - An overview Stiller, C., Puente León, F., Kruse, M. Information Fusion, 2011 https://www.scopus.com/pages/publications/79958207223?origin=scopusAI

74. Learning to control and coordinate mixed traffic through robot vehicles at complex and unsignalized intersections Wang, D., Li, W., Zhu, L., Pan, J. International Journal of Robotics Research, 2025 https://www.scopus.com/pages/publications/105001967986?origin=scopusAI

75. Traffic information and control Li, R., He, Z. Traffic Information and Control, 2021 https://www.scopus.com/pages/publications/85114561790?origin=scopusAI

76. Game theory and cooperative-competitive performances in real time traffic signal settings based on floating car data Astarita, V., Giofre, V.P., Guido, G., Vitale, A. MT-ITS 2019 - 6th International Conference on Models and Technologies for Intelligent Transportation Systems, 2019 https://www.scopus.com/pages/publications/85074920568?origin=scopusAI

77. RT-FedFlow: An efficient framework for real-time traffic signal optimization using federated multi-agent reinforcement learning Akbar, A., Ullah, S.S., Malik, A., Mian Qaisar, S. Engineering Applications of Artificial Intelligence, 2025 https://www.scopus.com/pages/publications/105015881958?origin=scopusAI

78. A Novel Framework for Traffic Congestion Management at Intersections Using Federated Learning and Vertical Partitioning Chougule, A., Chamola, V., Hassija, V., (...), Yu, F.R. IEEE Transactions on Consumer Electronics, 2024 https://www.scopus.com/pages/publications/85174812695?origin=scopusAI

79. Adaptive and Privacy-Preserving Federated Learning for Real-Time Smart Traffic Systems Using Hybrid Deep Models Nachankar, A.P., Ansari, N.A., Jain, P. KSII Transactions on Internet and Information Systems, 2025 https://www.scopus.com/pages/publications/105022188761?origin=scopusAI

80. A traffic-aware federated learning prediction framework with custom aggregation Kaur, S., Sehra, S.S., Ebrahimi, D., Mohammed, E.A. Machine Learning with Applications, 2026 https://www.scopus.com/pages/publications/105026235700?origin=scopusAI

81. Privacy preserving hierarchical federated learning approach for secure urban mobility prediction Naresh, V.S., Ayaaappa, D. Peer-to-Peer Networking and Applications, 2025 https://www.scopus.com/pages/publications/105010167169?origin=scopusAI

82. Federated Learning in Mobile Networks: A Comprehensive Case Study on Traffic Forecasting Pavlidis, N., Perifanis, V., Yilmaz, S.F., (...), Dini, P. IEEE Transactions on Sustainable Computing, 2025 https://www.scopus.com/pages/publications/85210383329?origin=scopusAI

83. Hybrid information systems for modeling traffic management and control Babu, G.N., Harikrishna, K., Rao, K.V. Hybrid Information Systems: Non-Linear Optimization Strategies with Artificial Intelligence, 2024 https://www.scopus.com/pages/publications/85199946399?origin=scopusAI

84. Risk Assessments Integrating V2X into Cooperative Driving Automation Correa-Jullian, C., Mosleh, A., Ma, J. Proceedings - Annual Reliability and Maintainability Symposium, 2025 https://www.scopus.com/pages/publications/105002271747?origin=scopusAI

85. Traffic Signal Optimization using Real-Time Pedestrian and Vehicle Counts Gomathi, S., Sharan Sampath Kumar, V.B., Rithish Kumar, G., Thiruvenkadakrishnan, S. Proceedings of the International Conference on Intelligent Computing and Control Systems, ICICCS 2025, 2025 https://www.scopus.com/pages/publications/105007528081?origin=scopusAI

86. CityFlow: A multi-agent reinforcement learning environment for large scale city traffic scenario Zhang, H., Ding, Y., Zhang, W., (...), Jin, H. The Web Conference 2019 - Proceedings of the World Wide Web Conference, WWW 2019, 2019 https://www.scopus.com/pages/publications/85066891747?origin=scopusAI

87. CSI-FL: Communication-Sensing Integrated Federated Learning Framework for Heterogeneous IoV Zhang, J., Hou, H., Zhang, M., (...), Ye, X. IEEE Transactions on Computational Social Systems, 2025 https://www.scopus.com/pages/publications/105008551289?origin=scopusAI

88. Learning Simultaneous and Sequential Decisions in Multi-Agent Systems With Application to Traffic Signal Control Zhang, H., Wang, Z., Yu, J., (...), Wang, W. IEEE Transactions on Intelligent Transportation Systems,

2025 https://www.scopus.com/pages/publications/105003376822?origin=scopusAI

89. Investigating the synergistic effects of temporal knowledge graphs and digital twin technologies to enhance situational awareness decision-making in smart cities He, F., Bai, W., Wang, Z. Journal of Computational Methods in Sciences and Engineering, 2025 https://www.scopus.com/pages/publications/105007146879?origin=scopusAI

90. Enhancing Security and Privacy in 6G V2X Communication: Leveraging Homomorphic-Encryption for Confidentiality-Preserving Computation Sandosh, S., Rout, K., Reddy, A., Kumar, S. Lecture Notes in Networks and Systems, 2026 https://www.scopus.com/pages/publications/105029701509?origin=scopusAI
